# OptiMiser V3 Presents Audit Wizard
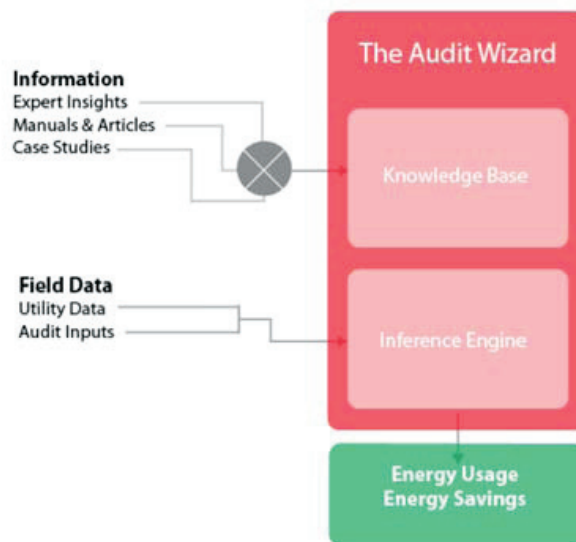

OptiMiser Wizard leverages data and reduces guesswork to make audits faster and more accurate.

OptiMiser V3, currently in beta testing, will bring new power to the auditor: an expert system that requires fewer inputs and produces better results. The Audit Wizard brings years of research, field work, and feedback from experienced auditors to your fingertips.
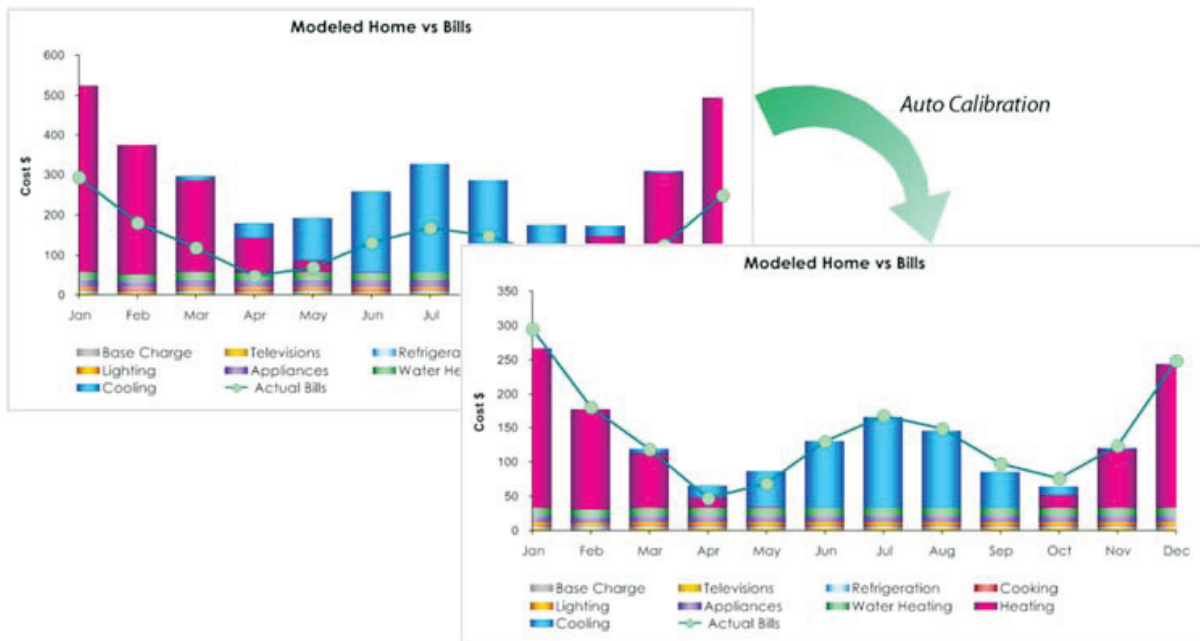

The Wizard guides the user through the audit step by step, presenting the most important inputs along with instructional text and tips. The new system speeds up audits and reduces the confusion of too many inputs, many of which have minor impacts on the model.

The Audit Wizard maintains the flexibility and control of OptiMiser's standard interface. All detailed tabs are available from within the Wizard. Select "Detailed Inputs" and you can switch to the standard tab interface. Use simplified Wizard inputs for some components, and Detailed inputs on others. OptiMiser V3 with the Audit Wizard is fully compatible with files created with previous versions.

The V3 Wizard offers a fully-automated utility calibration system. This system eliminates the need to go back over the model and "true up" inputs to match utility

usage. With good utility bills, the auditor can specify ranges where determining an exact value is too time consuming (e.g. window area) or unavailable (e.g. R-value of cavity insulation). Inputs for the calibration are gathered naturally as you progress through the audit.

V3 is expected to roll out to all OptiMiser users in early February. OptiMiser is currently seeking additional beta testers for V3 with the Audit Wizard. Beta testers will receive free high priority customer support through the duration of the testing period and will provide critical input as we finalize the design of this powerful new tool.
